A typical fiber optic connector includes a ferrule which mounts and centers an optical fiber or fibers within the connector. The ferrule may be fabricated of such material as ceramic. A ferrule holder or other housing component of the connector embraces the ferrule and may be fabricated of such material as molded plastic. A spring may be disposed within the housing or ferrule holder such that the ferrule is yieldably biased forwardly for engaging another fiber-mounting ferrule of a mating connecting device. A pair of fiber optic connectors or a connector and another optical fiber transmission device often are mated in an adapter. The adapter couples the two fiber optic connectors together end-to-end. The adapter typically includes alignment mechanisms for receiving the ferrules of the two fiber optic connectors and providing movement of the fiber optic connectors relative to each other so that the fiber spacing is consistent from one fiber optic connector to the next and from one adapter to the next. An adapter design such as that disclosed in commonly assigned U.S. Pat. No. 5,317,663, provides a mechanical advantage in coupling the fiber optic connectors or the connector and another optical fiber transmission device. The adapter includes a resiliently deformable sleeve that is biased to an insertion position. The fiber optic connectors are biased toward the adapter sleeve and into engagement with the adapter sleeve when the fiber optic connectors are pushed into engagement with the adapter. In this “push-in” type of
